anaconda3安装问题

在后面的某些版本中，linux下安装anaconda3可能会出现一直卡在unpacking payload状态下，这个是安装包的bug。

解决方式：

- 单核的电脑会出现此问题，需要双核或以上才可以。如果是虚拟机安装，直接将虚拟机内核个数设置为双核或以上就行。
- 或者直接安装一个之前的旧版本，比如安装旧版的Anaconda，如Anaconda3-2019.07-Linux-x86_64.sh，√。

- I just created my account so can’t add a comment to the answer above, but thought I would confirm that Anaconda cannot be installed if you’re running on a Linux machine with only one CPU. The Anaconda bug I found for this is https://github.com/conda/conda/issues/9345 although it’s closed as fixed even though it does still exist in the current non-mini Anaconda download Anaconda3-2019.10-Linux-x86_64.sh.

In VMWare, this is solved by shutting the VM down, going to Virtual Machine > Settings > Processors and Memory and selecting 2 or more processor cores.
